

Environment and Energy Policy

With the definition of our environment and energy policy, we emphasize the relevance of an environment and energy management system for profine.

We commit ourselves to maintain a sustainable production by optimum use of suitable resources. The supreme goods of our company are our employees, our customers and the environment.

In this context, our environment and energy management system goes hand in hand with our comprehensive sustainability maxim which we put into practice by energy efficient window systems, lead-free stabilizer systems in the virgin material and sophisticated recycling concepts.

All this is aimed to save the energetic resources used. With the implementation and the maintenance of an energy management system, we will significantly improve the efficiency of the energetic performance by continuous improvement process, as well as by considering necessary technical innovation. Besides energy consumption, all environmental stresses, such as sewage, material consumption, waste and greenhouse emissions are continuously monitored by us and reduced to their minimum.

Our environment and energy management system is optimized based on the specific technical, organizational and process-related parameters.

We want to be the most sustainable company in our industry, covering the whole supply-chain from procurement of machinery and raw materials to production up to supply to our customers.

In this context, we undertake, of course, to comply with all relevant legal and other provisions.

And we ask for the same standards with regard to working methods and handling of resources to be applied by our business partners and persons within our sphere of influence.

All employees and the public are informed about our environment and energy policy. Furthermore, responsibilities, resources and competencies are clearly defined and laid down.

We invest in the competencies of our staff members to enable them to significantly contribute to the achieving our targets. On all corporate levels, environmental awareness is raised by training initiatives.

The foundation of our energy and management systems are the provisions of ISO 50001 and ISO 14001. On this basis, we set our standards which we will adhere to to the best of our knowledge and belief.
